

Empowered Instruction

Classroom Performance System

Engage students and assess real-time lecture retention with this simple yet powerful wireless application. You can even deliver tests that instantly grade themselves.

PORTER'S THREE GENERIC STRATEGIES

- Porter identified 3 generic business strategies for beating the competition

- Overall cost leadership
- Differentiation
- Focus

Narrow market scope	Focus Strategy	
Broad market scope	Differentiation Strategy	Overall Cost Leadership
	Unique competency	Low-cost competency

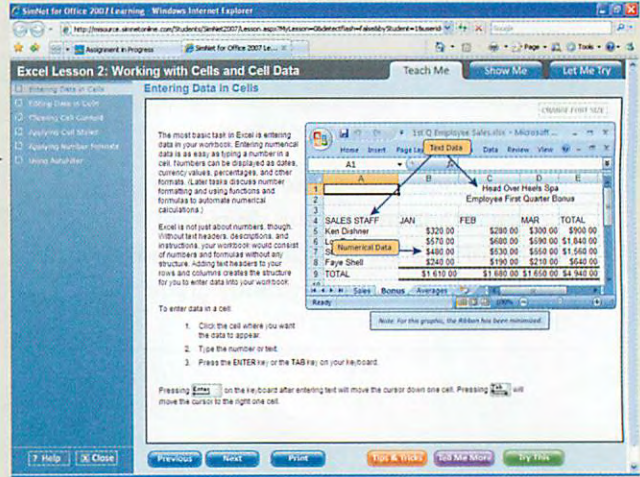

1-36

PowerPoint Presentation

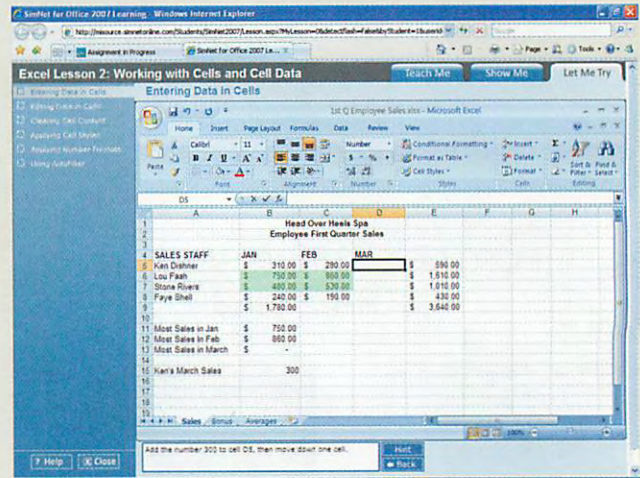

Robust, detailed, and designed to keep students engaged.

Software Skills & Computer Concepts
 MISource provides animated tutorials and simulated practice of the core skills in Microsoft Office 2007 Excel, Access, and PowerPoint.

Spend less time reviewing software skills and computer literacy.

VIDEOS

New videos will be downloadable from the instructor side of the OLC. Selections from our archive of videos from previous years will be delivered upon request.

MBA MIS CASES

Developed by Richard Perle of Loyola Marymount University, these 14 comprehensive cases allow you to add MBA-level analysis to your course. Visit our Web site to review a sample case.

ONLINE LEARNING CENTER

Visit www.mhhe.com/haag for additional instructor and student resources.

ONLINE COURSES

Content for the Seventh Edition is available in WebCT, Blackboard, and PageOut formats to accommodate virtually any online delivery platform.

EXTENDED LEARNING MODULE CD-ROM

This text is packaged with a student CD (0073308900) that contains eight *Extended Learning Modules* (D—Office 2003 version, F, G, I, J—Office 2003 version, K, L, and M). All your students have to do is go to the CD to read the full module.

USE OUR EZ TEST ONLINE TO HELP YOUR STUDENTS PREPARE TO SUCCEED WITH APPLE IPOD® IQUIZ.

Using our EZ Test Online you can make test and quiz content available for a student's Apple iPod®.

Students must purchase the iQuiz game application from Apple for 99¢ in order to use the iQuiz content. It works on the iPod fifth generation iPods and better.

Instructors only need EZ Test Online to produce iQuiz ready content. Instructors take their existing tests and quizzes and export them to a file that can then be made available to the student to take as a self-quiz on their iPods. It's as simple as that.

Acknowledgments

As we present our Seventh Edition of this text, we remember how things began and the people who have helped us along the way. In 1995, the Web was very much in its infancy, cell phones were used only in case of an emergency, and terms such as phishing and pharming had yet to be invented. It's been a fast 12 years and we have many people to thank.

McGraw-Hill's strategic management is simply second to none. We gratefully acknowledge the dedicated work and leadership of Ed Stanford, Kevin Kane, and David Littlehale. Their guidance is invaluable.

EDP includes all those people who take our thoughts on paper and bring them to life in the form of an exciting and engaging book. This wonderful group of people includes Mary Conzachi (the book's project manager), Peter de Lissovoy (our manuscript editor), Jeremy Cheshareck (photo research coordinator), and Cara David (cover and interior design specialist).

The editorial group comprises those people who determine which projects to publish, and they have guided us every step of the way with a wealth of market intelligence. Stewart Mattson (publisher) leads the editorial group that includes Scott Isenberg (our senior sponsoring editor) and Trina Hauger (the book's developmental editor). We are indebted to them for leading the way.

We would also like to acknowledge the dedicated work of the following people at McGraw-Hill: Cathy Tepper (media project manager) and Sankha Basu (marketing manager). Without Cathy, our text would be just a text, with no supplements or great supporting Web site. Without Sankha, you might never know we created this text.

We wish to acknowledge the wonderful efforts of our contributor team: Dan Connolly, David Cox, Laura Nee, Jeff Engelstad, Syl Houston, and Keith Neufeld. Each has brought to the table unique talents and knowledge indispensable to the success of this text.

Last, but certainly not least, we offer our gratitude to our reviewers, who took on a thankless job that paid only a fraction of its true worth. We had the best. They include

FROM THE AUTHORS

FROM STEPHEN HAAG To the entire author team—coauthors and contributors alike—I commend you for all your efforts. I am also grateful to the many people who helped me along the career path of writing books. They include Peter Keen, Dr. L. L. Schkade, JD Ice, Rick Williamson, Paul Ducham, and a host of people at McGraw-Hill.

My colleagues in the Daniels College of Business at the University of Denver also provide support. I wish I could name all of you, but there isn't enough room. To James Griesemer (Dean Emeritus), Karen Newman, and Glyn Hanbery (Senior Associate Dean), I thank you all.

And my writing efforts would not be successful nor would my life be complete without my family. My mother and father live just a few minutes away from me and give me unending support. My two sons—Darian and Trevor—make me smile after long nights of working. My four-legged son—Zippy—doesn't really care that I write books; he offers me unconditional love. And I have a new daughter, Alexis, who we adopted in the summer of 2007 from the Ukraine. I cannot put into words how much happiness she has brought into our lives. Finally, my wife, Pam, should be listed as a coauthor on many of my books. Her work is never done, and she loves every minute of it.

FROM MAEVE CUMMINGS My sincere thanks to the many people who helped directly and indirectly with this edition and the previous ones. Thanks to Steve, who is every bit as good a friend as he is a lead author. Thanks to all the people at McGraw-Hill who put in long hours and a lot of work to bring this book to completion.

A special thanks to Keith Neufeld, who is an expert on networks and generous with his knowledge, and to Lanny Morrow, who keeps me in touch with the fascinating world of computer forensics. Felix Dreher and Barbara Clutter were, and always have been, unwaveringly supportive and helpful.

Thanks to the Holy Faith and Loreto nuns who gave me an excellent early education, which served as a solid foundation on which I was able to build. These were exceptionally dedicated teachers and I learned much more from them than the basics of reading, writing, and arithmetic. Much credit goes to Jan Guynes Clark, who helped me through several exhilarating and terrifying years at the University of Texas at Arlington.

As always, I want to thank my great family: my parents (Dolores and Steve), sisters (Grainne, Fiona, and Clodagh), and brother (Colin). And last, but by no means least, thanks to my husband, Slim, for making everything I do possible.

ABOUT THE AUTHORS

STEPHEN HAAG is a professor of Information Technology and Electronic Commerce in the Daniels College of Business at the University of Denver. Previously, Stephen has served as Chair of the Department of Information Technology and Electronic Commerce, Director of the Master of Science in Information Technology program, Director of the MBA program, and Associate Dean of Graduate Programs. Stephen holds a B.B.A. and M.B.A. from West Texas State University and a Ph.D. from the University of Texas at Arlington.

Stephen is the author/coauthor of numerous books including *Computing Concepts in Action* (a K-12 textbook), *Interactions: Teaching English as a Second Language* (with his mother and father), *Information Technology: Tomorrow's Advantage Today* (with Peter Keen), *Excelling in Finance, Business Driven Technology*, and more than 40 books within the *I-Series*. He has also written numerous articles appearing in such journals as *Communications of the ACM*, *Socio-Economic Planning Sciences*, the *International Journal of Systems Science*, *Managerial and Decision Economics*, *Applied Economics*, and the *Australian Journal of Management*. Stephen lives with his family in Highlands Ranch, Colorado.

MAEVE CUMMINGS is a professor of Information Systems at Pittsburg State University. She holds a B.S. in Mathematics and Computer Science and an M.B.A. from Pittsburg State and a Ph.D. in Information Systems from the University of Texas at Arlington. She has published in various journals including the *Journal of Global Information Management* and the *Journal of Computer Information Systems*. She serves on various editorial boards and is a coauthor of *Case Studies in Information Technology*, the concepts books of the *I-Series*, entitled *Computing Concepts* and *Information Systems Essentials*, now in its second edition. Maeve has been teaching for 25 years and lives in Pittsburg, Kansas, with her husband, Slim.

Management Information Systems

FOR THE INFORMATION AGE

CHAPTER ONE OUTLINE

STUDENT LEARNING OUTCOMES

1. Define management information systems (MIS) and describe the three important organizational resources within it—people, information, and information technology.
2. Describe how to use Porter's Five Forces Model to evaluate the relative attractiveness of and competitive pressures in an industry.
3. Compare and contrast Porter's three generic strategies; top line versus bottom line; and the run-grow-transform framework as approaches to the development of business strategy.
4. Describe the role of value-chain analysis in identifying value-added and value-reducing processes.

PERSPECTIVES

- 11 **Global Perspective**
Overcoming Language Barriers on the Internet
- 14 **Industry Perspective**
E-Learning: Not Just for School
- 20 **Industry Perspective**
Comparing the E-Commerce Activities of Different Governments—A New Kind of Competition
- 24 **Industry Perspective**
Creating Synergy among Top Line and Bottom Line

WEB SUPPORT

www.mhhe.com/haag

- Searching job databases
- Interviewing and negotiating tips
- Financial aid resources
- Protecting your computer
- Ethical computing guidelines
- Global statistics and resources

SUPPORTING MODULES

XLM/A: Computer Hardware and Software

Extended Learning Module A is a comprehensive tour of technology terminology focusing on personal technologies including application software, system software, input devices, output devices, storage devices, CPU and RAM, and connecting devices such as cables and ports.

XLM/K: Careers in Business

Extended Learning Module K is an overview of job titles and descriptions in the fields of accounting, finance, hospitality and tourism management, information technology, management, marketing, productions and operations management, and real estate and construction management including what IT skills you should acquire to be successful in each field.

CHAPTER ONE

The Information Age in Which You Live Changing the Face of Business

OPENING CASE STUDY: IS YOUR SOCIAL SECURITY NUMBER WORTH \$98?

The answer for many people is yes. But they're not referring to the worth of their own social security numbers; they're referring to how much they are willing to pay for *your* Social Security number. And they're willing to pay for other data such as:

- \$490—credit number and PIN.
- \$78–\$294—billing data including account number, address, birth date, etc.
- \$147—driver's license number.
- \$147—birth certificate.
- \$6–\$24—credit card number with security code and expiration date.
- \$6—PayPal logon and password.

On the Internet, you can find sites such as CardingWorld.cc, Dumps International, and TalkCash.net that sell such information and much more including malware, software that can be used to infiltrate the identity management systems of organizations and steal personal information. These sites typically stay in existence only for about six months or so before having to change their names to elude law enforcement officials.

From a personal point of view, identity theft should be high on your priority list. From an organizational point of view, identity management and the protection of identity information are usually at the top of the priority list. Unfortunately, hackers have found ways to steal identity information; they may spoof or phish you into giving away your personal information and they may unleash malware (the generalized term for malicious software such as viruses, worms, and Trojan horses) on organizational identity management systems to steal millions of identities. In late 2006, TJX Holdings—the parent company

for retail outlets including T. J. Maxx, Marshalls, and HomeGoods—reported the infiltration of its identity management systems, which may eventually affect over 40 million customers.

By some accounts, the black market for identity information is now a billion-dollar-a-year industry. Transactions occur daily with the buying and selling of identities, credit card information, and even brokerage accounts. One man stole numerous online brokerage accounts and used them to employ the old “pump-and-dump” stock scam. With his legitimate personal account he bought many shares of a penny stock. He then used the accounts he'd stolen to buy more shares of the same stock, which raised the price significantly. He then sold the shares in his legitimate personal account for a tidy profit of \$82,000. We can tell you this story because he got caught.

In today's digital world, computers can be used for all sorts of nefarious scams; they can also be used in many wonderful and legal ways—to increase profit, to reduce costs, to increase product and service quality, to reach suppliers and customers all over the world, and to benefit society in general. This book focuses on helping you learn to use technology for the sustained competitive advantage of your organization and for your personal productivity. Along the way, however, we will talk about the bad uses of technology and inform you of steps you can take to avoid being a victim of cyber crimes.¹

Questions

1. Have you, a friend, or a family member been a victim of identity theft? If so, tell the story to your class.
2. How often do you buy your credit report? Did you know you get one for free annually?
3. Is technology good or bad?

Introduction

You live in the “digital age.” You live, work, learn, play, drive, network, eat, and shop in a digital world. The influence of technology permeates everything you do. The average American relies daily on more than 250 computers. Every part of your life depends on technology. Your TV, iPod, DVD player, car, and cell phone are all technology enabled and—more important—not “able” without technology. Technology is so pervasive in your life it is often considered “invasive.” Here’s a wild statistic: According to a worldwide survey conducted by *Time* magazine in 2005, 14 percent of cell phone users stated they had stopped having sex to take a phone call.² Hmmm . . .

Your generation, specifically, the group of people born in the mid-to-late 1980s and very early 1990s, was born into the digital age unlike older people. In the early 1990s, few people as yet had ever heard of the Internet, “surfing” was a term identified only as a water sport, and Microsoft was not the dominant software publisher for word processing, spreadsheet, presentation, or DBMS applications. Viruses were seen only under a microscope, worms were used for fishing, and “spam” was just a canned meat. But all this changed in your first years on earth.

As you moved through your early teens, e-commerce exploded and then quickly imploded, transforming overnight Internet millionaires into overnight Internet paupers. You are probably more than familiar with unique and interesting IT terms such as podcasting, wiki, avatars, emoticons, spoofing, acorns, and phishing (now with a completely different kind of bait). Technology has been so much a part of your life that you may consider it more of a necessity than a convenience.

Generations of people before you witnessed the evolution and revolution of many other technologies, automobiles, airplanes, radios, televisions, telephones. Your generation has been at the center of the digital revolution. Perhaps more than any technology before, digital technologies such as computers and the Internet have radically transformed the very fabric of how people live their lives.

The reach of digital technologies is vast and wide. Technology touches your personal life every day. Equally so, digital technologies have dramatically altered the competitive landscape of business. Fifty of the *Fortune* top 500 companies in 2006 (that’s one in every 10) were digital technology companies such as Cisco Systems, Hewlett-Packard, and Dell. Dell was formed in 1984 (about the time you were born); now it has over 65,000 employees worldwide. Its famous sell-source-ship model of delivering custom personal computers directly to consumers is the envy of the industry. Amazon.com ranked 272 on the *Fortune* list and eBay ranked 458—both of these companies have been around for only about 10 years.³

Technology companies are by no means the only ones interested in using technology effectively in the workplace. Every business you can name wrestles with management information systems on a daily basis. Broadly, *management information systems* is both a business discipline that deals with the use of information technology (IT)—or computers, computer technology, or simply technology—and an academic field of study. Technology is so important to businesses because we are in the information age, a time when knowledge is power. Today, more than ever, businesses need information, information technology, and the overarching MIS function to massage, assimilate, and distribute information and knowledge to create and sustain a competitive advantage.

As businesses approach the acquisition and use of technology, they do so very differently from you in your personal life. You find a cool piece of technology and quickly calculate in your head if you have enough money to purchase it. You may not get everything you want, such as a large hard disk or a really fast processor, but you can usually buy the personal technology you need. Businesses are different; they carefully scrutinize their

technology purchases, seeking to find and justify a competitive advantage and a return on a big investment. Businesses ask such questions as

1. Can this technology help streamline and lower the cost of our business processes while not sacrificing the quality we deliver to our customers?
2. Can this technology enable us to reach larger markets of customers, understand our customers better so we can deliver more tailored products and services to them, and/or help us design and develop products that are better than the competition's?
3. Can this technology enable us to innovate our business operations and move into completely new markets?

This book's goal is to introduce you to the fast-paced and ever-changing dynamics of information technology, focusing specifically on (1) how you—as an individual—can use technology to increase your productivity and (2) how organizations can use technology to increase profit, expand market share, serve the needs of society, eliminate time and location boundaries, and engage in a host of other worthy activities. We deliver on the first goal—increasing your personal productivity—through the use of our extended learning modules, which typically are hands-on, “can-do” explorations of technology such as how to use the decision support features in Excel (*Extended Learning Module D*), build a Web page (*Extended Learning Modules F and L*), and design and use a database and database management system (*Extended Learning Modules C and J*).

We deliver on the second goal—explaining organizational uses of technology—in the book's chapters. We'll start in this very first chapter by stating that *business strategy drives technology decisions, not the reverse*. This is a “refinement approach” that moves from the big picture (the industry in which your business operates) to the details (the technologies you should choose). So, you start with the bigger view of your industry and continually refine your analysis until you arrive at the technologies you should use (see Figure 1.1).

Business First

Figure 1.1

How Businesses Decide
What Technology to Use

The steps are as follows:

1. Assess the state of competition and industry pressures affecting your organization.
2. Determine business strategies critical to successfully address those competitive and industry pressures.
3. Identify important business processes that support your chosen business strategies.
4. Finally, align technology tools with those important business processes.

So, you first need to understand the industry in which your business operates and the competitive forces affecting that industry. Decisions regarding business strategies, business processes, and finally technology follow. Your organization must perform these steps in this order. If you don't understand the competitive nature of your industry, you can't determine business strategies that ensure success. If you don't then identify the most important business processes to support those business strategies, you will undoubtedly implement the wrong technologies and doom your organization to failure. It is our goal in this first chapter to help you through the first two steps above. The remaining chapters focus on further refinement of business strategies and the identification of important business processes—and the technology tools that support them.

Management Information Systems

Just like finance, accounting, marketing, and many others, *management information systems* is a business function vitally important to the success of your organization. Formally, we define management information systems as follows:

- **Management information systems (MIS)** deals with the planning for, development, management, and use of information technology tools to help people perform all tasks related to information processing and management.

So, MIS deals with the coordination and use of three very important organizational resources—information, people, and information technology. Stated another way, *people* use *information technology* to work with *information*. And to do so they are involved in MIS. Ideally, of course, people use technology to support the goals and objectives of the organization as driven by competitive pressures and determined by appropriate business strategies. MIS helps them to do this.

INFORMATION AS A KEY RESOURCE

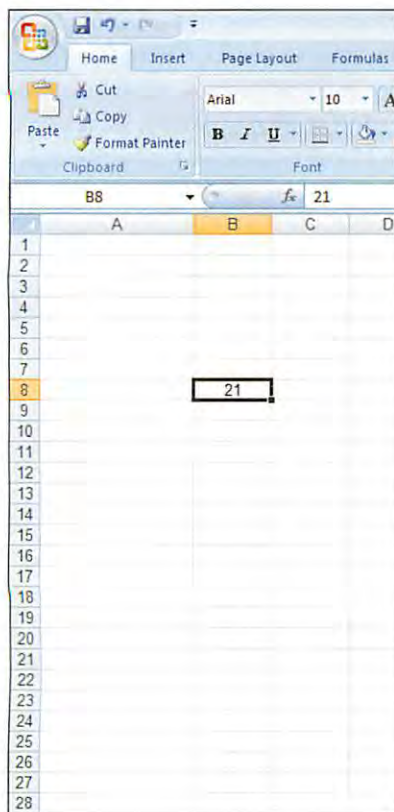

As the truism goes, we are in the information age, a time when knowledge is power. But what *are* information and knowledge? Let's first define *data*, *information*, and *business intelligence* and give an example to understand them better. Finally, we'll discuss the elusive term *knowledge*.

- **Data** are raw facts that describe a particular phenomenon such as the current temperature, the price of a movie rental, or your age. (Actually, the term *data* is plural; *datum* is singular.)

LEARNING OUTCOME 1

- **Information** is data that have a particular meaning within a specific context. The current temperature becomes information if you're deciding what to wear; in deciding what to wear, the data describing the price of a movie rental are not pertinent information.
- **Business intelligence (BI)**—collective information – about your customers, your competitors, your business partners, your competitive environment, and your own internal operations that gives you the ability to make effective, important, and often strategic business decisions.

Consider Figure 1.2. In the left is a single Excel cell containing the number 21; let's assume that's your age. That is a piece of data, some sort of fact that describes the amount of time you have been alive. Now let's create a list of customers for a business that contains the age of each customer (the right portion of Figure 1.2). This is potential *information* since your business can use it. Notice that you can create an average, find the ages of the youngest and oldest customers, and build a frequency distribution of customers by age.

In an Excel cell, you can store a single piece of data. Here, the cell contains the number 21, which we're assuming to be your age.

Data become information when they take on meaning. Here, information is a list of ages of all customers, which starts to provide insight into your customers.

Figure 1.2
Data and Information

Now, look at Figure 1.3. There you'll see an Excel workbook containing many pieces of information for each customer. This is *business intelligence*. What does this mean? Take a careful look at some of the columns of information. For each customer, we know the preferred salesperson. We can also see the number of coupons each customer has used. Now we can start to derive more meaningful information—business intelligence. We can compare how men and women use coupons. We can derive the customer average age by preferred salesperson.

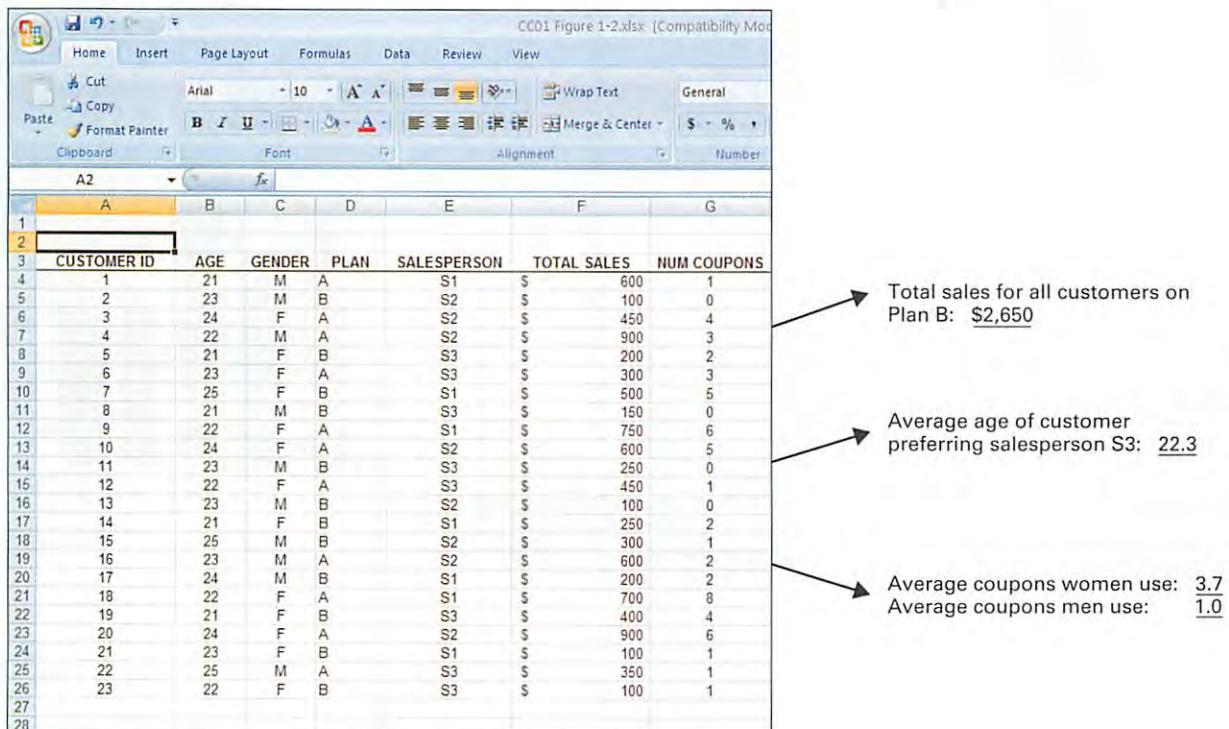

Notice how data, information, and business intelligence all build on each other. Information is a more complete picture of multiple data points; in our example, an age was a single piece of data while information was the collective ages of all customers. Business intelligence extends that information to include gender behaviour, the use of coupons, preferred salespersons, and total purchases. And *knowledge* builds upon all of those. You acquire knowledge in a business or field through practice over time using information and intelligence. You will understand better what we mean by knowledge as we go along.

Knowledge is a broad term that can describe many things (1) it can provide contextual explanation for business intelligence; (2) it can point toward actions to take to affect business intelligence; (3) it can include intellectual assets such as patents and trademarks; and (4) it includes organizational know-how for things such as best practices.

Consider our example in Figures 1.2 and 1.3. Knowledge can provide context by explaining the reason that more women than men use coupons is that the majority of coupons are placed in women's magazines. You would derive this sort of knowledge by having the business intelligence in Figure 1.3 and at the same time having access to the marketing strategies. Given the business intelligence in the figure, the knowledge of individuals in the organization would help them make use of it. Knowledge would address what marketing strategy, for instance, should be undertaken to get more customers on Plan B to increase total purchases.

Figure 1.3

Business Intelligence

When you start to combine multiple sets of information, you can generate a considerable amount of business intelligence. Business intelligence helps you make effective strategic business decisions.

The *quality* of intelligence and knowledge is obviously critical. We'll talk next about the quality of these assets. Quality has different meanings in different contexts. Then we'll discuss some other characteristics of information. (In the following discussion, we'll be using the term *information* generically to refer to all intellectual assets—data, information, business intelligence, and knowledge. We don't mean to be confusing, but the fact is that the term *information* is also used by business people and academics alike in a shorthand fashion in this way.)

DEFINING INFORMATION QUALITY Information exhibits high quality only if it is pertinent, relevant, and useful to you. Unfortunately, in today's information age, information is not exactly at a premium; you are bombarded daily with information, much of which is not really important to you in any way. Below are some information attributes that help define its quality.

- **Timeliness**—There are two aspects here. Do you have access to information *when you need it*? If you're preparing to make a stock trade, for example, you need access to the price of the stock right now. Second, does the information describe the time period or periods you're considering? A snapshot of sales today may be what is relevant. Or for some important decisions, you really need other information as well—sales yesterday, sales for the week, today's sales compared to the same day last week, today's sales compared to the same day last year, and so on.
- **Location**—Information is of no value to you if you can't access it. Ideally, your location or the information's location should not matter. IT can definitely create information quality here with technologies that support telecommuting, workplace virtualization, mobile e-commerce, and so on, so you can access information at or from any location.
- **Form**—There are two aspects here also. Is the information in a form that is most useful to or usable by you—audio, text, video, animation, graphical, or other? Depending on the situation, the quality of information is defined by its form and your ability to make use of it. Second, is the information free of errors? Think of information as you would a physical product. If you have a defective product, it lacks quality in that you cannot use it. Information is the same. This is the concept of *garbage-in garbage-out (GIGO)*. If the information coming into your decision-making process is in bad form (i.e., garbage-in), you'll more than likely make a poor decision (i.e., garbage-out).
- **Validity**—Validity is closely related to the second aspect of form above. Validity addresses the credibility of information. Information is all over the Internet, but does it come from a credible source? Much of the information on the Internet has not gone through any sort of quality control or verification process before being published, so you have to question its validity.

CONSIDERING INFORMATION FROM AN ORGANIZATIONAL PERSPECTIVE

Organizations must treat information as any other resource or asset. It must be organized, managed, and disseminated effectively for the information to exhibit quality. Within an organization, information flows in four basic directions (see Figure 1.4 on the next page):

1. **Upward.** Upward information flows describe the current state of the organization based on its daily transactions. When a sale occurs, for example, that information originates at the lowest level of the organization and is passed upward through the various levels. Along the way, the information takes on a finer level of *granularity*. **Information granularity** refers to the extent of detail within the information. At lower organizational levels, information exhibits fine granularity because people need to work with information in great detail. At the upper

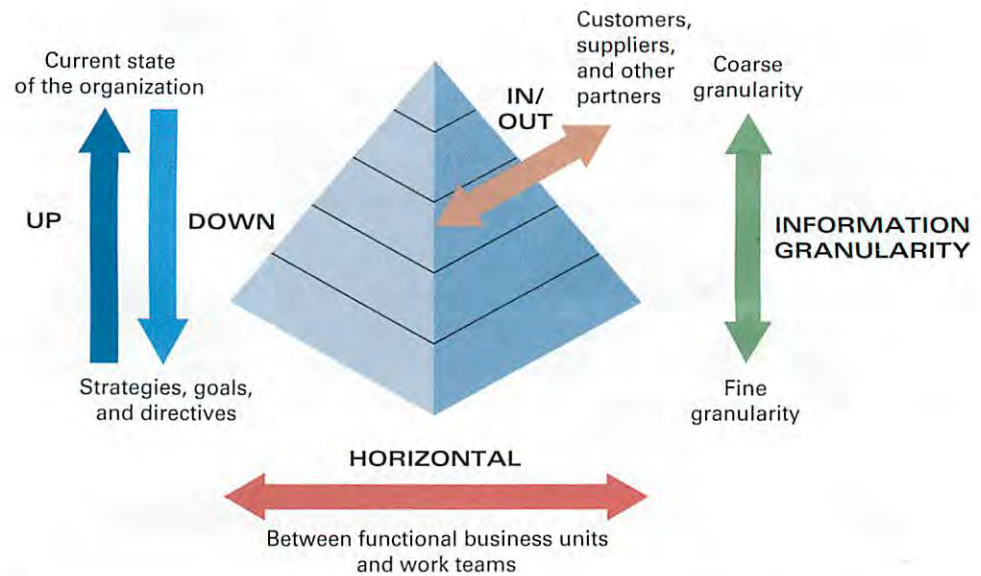

Figure 1.4

An Organization, Its Information Flows, and Information Granularity

organizational levels, information becomes coarser because it is summarized or aggregated in some way. That is, strategic managers need sales by year, for example, as opposed to knowing the detail of every single transaction.

2. **Downward.** Strategies, goals, and directives that originate at a higher level are passed to lower levels in downward information flows. The upper level of an organization develops strategies; the middle levels of an organization convert those strategies into tactics; and the lower levels of an organization deal with the operational details.
3. **Horizontal.** Information flows horizontally between functional business units and work teams. The goal here is to eliminate the old dilemma of “the right hand not knowing what the left hand is doing.” All units of your organization need to inform other units of their processes and be informed by the other units regarding their processes. In general, everyone in a company needs to know everything relevant in a business sense (personal, sensitive data not included).
4. **Outward/inward.** Information is communicated from and to customers, suppliers, distributors, and other partners for the purpose of doing business. These flows of information are really what electronic commerce is all about. Today, no organization is an island, and outward/inward flows can yield a competitive advantage.

Another organizational perspective on information regards what information describes. Information is internal or external, objective or subjective, and various combinations of these.

- **Internal information** describes specific operational aspects of an organization.
- **External information** describes the environment surrounding the organization.
- **Objective information** quantifiably describes something that is known.
- **Subjective information** attempts to describe something that is unknown.

Consider a bank that faces the decision about what interest rate to offer on a CD. That bank will use internal information (how many customers it has who can afford to buy a CD), external information (what rate other banks are offering), objective information (what is today’s prime interest rate), and subjective information (what the prime interest rate is expected to be in the future). Actually, the rate other banks are offering is not only external information (it describes the environment surrounding the organization) but objective information (it is quantifiably known). Information usually has more than one aspect to it.

GLOBAL PERSPECTIVE

OVERCOMING LANGUAGE BARRIERS ON THE INTERNET

The Internet is certainly a disruptive technology that has eliminated geographical and location barriers. With almost one-sixth of the world's population having access to the Internet, "location, location, location" in the physical world is becoming less and less and less important.

However, we now have new issues to deal with, notably a language barrier. What happens if you connect to a site that offers information in a language you don't understand? How can you send an e-mail to someone in Japan who doesn't speak English?

One solution is language translation software, and one company leading the way in the development of language translation software is SYSTRAN. SYSTRAN offers a suite of software tools that enables you, among other things, to translate about 3,700 words per minute, translate e-mail, Web page, and pdf content, and display Asian fonts. Most of SYSTRAN's software products

are also available as plug-ins for Microsoft Outlook, Word, Excel, and PowerPoint.

Is it perfect? Not according to SYSTRAN's disclaimer. It states specifics about what its products will do, then encourages you to carefully review any translation before making it a part of your business communications.

Indeed, when Kentucky Fried Chicken wanted to translate its slogan "finger-lickin good" into Chinese, it came out as "eat your fingers off." Product names are another example. When General Motors tried to sell the Chevy Nova in South America, people didn't buy it because *No va* means "it won't go" in Spanish. (Neither of those two companies were using language translation software provided by SYSTRAN.)

Experiment with this. Connect to SYSTRAN's Web site at www.systransoft.com. Type in a phrase and choose the language into which you would like it translated.⁴

PEOPLE AS A KEY RESOURCE IN MIS

The single most important resource in any organization is its people. People set goals, carry out tasks, make decisions, serve customers, and, in the case of IT specialists, provide a stable and reliable technology environment so the organization can run smoothly and gain a competitive advantage in the marketplace. So, this discussion is all about *you*.

In business, your most valuable asset is *not* technology but rather your *mind*. IT is simply a set of tools that help you work with and process information. It's really a mind support tool set. Technology such as spreadsheet software can help you quickly create a high-quality and revealing graph. But it can't tell you whether you should build a bar or a pie graph, and it can't help you determine whether you should show sales by territory or sales by salesperson. Those are *your* tasks, and that's why your business curriculum includes classes in human resource management, accounting, finance, marketing, and perhaps production and operations management.

Nonetheless, technology is an important set of tools for you. Technology can help you be more efficient and can help you dissect and better understand problems and opportunities. So, it's as important for you to learn how to use your technology tool set as it's important that you understand the information to which you're applying your technology tools.

TECHNOLOGY LITERACY A *technology-literate knowledge worker* knows how and when to apply technology. The "how" aspect includes knowing which technology to purchase, how to exploit the many benefits of application software, and what technology infrastructure is required to get businesses connected to each other, just to name a few. From your personal perspective, we've provided extended learning modules in this text to help you become a technology-literate knowledge worker.

We encourage you to read all the extended learning modules, especially *Extended Learning Module K (Careers in Business)*. That module covers career opportunities in a variety of business disciplines including finance, marketing, accounting, management, and many others. Reading *Extended Learning Module K* will help prepare you for whatever career you choose. You'll find a discussion there of key technologies for each business discipline that will help you succeed in your career.

A technology-literate knowledge worker also knows “when” to apply technology. Unfortunately, in many cases, people and organizations blindly decide to use technology in a desperate effort to solve a business problem. What you need to understand is that technology is not a panacea. You can't simply apply technology to any given process and expect that process instantly to become more efficient and effective. Look at it this way—if you apply technology to a process that doesn't work correctly, then you'll only be doing things wrong millions of times faster. There are cases when technology is not the solution. Being a technology-literate knowledge worker will help you determine when and when not to apply technology.

INFORMATION LITERACY *An information-literate knowledge worker*

- Can define what information is needed.
- Knows how and where to obtain information.
- Understands the information once it is received (i.e., can transform the information into business intelligence).
- Can act appropriately based on the information to help the organization achieve the greatest advantage.

Consider a unique and real-life example of an information-literate knowledge worker. Several years ago, a manager of a retail store on the East Coast received some interesting information: diaper sales on Friday evenings accounted for a large percentage of total sales of that item for the week. Most people learning this would have immediately jumped to the decision to ensure that diapers were always well stocked on Friday evenings or to run a special on diapers Friday evenings to increase sales even further, but not our information-literate knowledge worker. She first looked at the information and decided that she needed more information in order to create business intelligence. She simply needed to know more before she could act.

She decided the business intelligence she needed was *why* a rash of diaper sales (pardon the pun) occurred on Friday evenings and *who* was buying the diapers. That intelligence was not stored within the computer system, so she stationed an employee in the diaper aisle on Friday evening to record any information pertinent to the situation (i.e., she knew how and where to obtain the information). The store manager learned that young businessmen purchased the most diapers on Friday evenings. Apparently, they had been instructed to buy the weekend supply on their way home from work. The manager's response was to stock premium domestic and imported beer near the diapers. Since then, Friday evening has been a big salestime not only for diapers but also for premium domestic and imported beer.

There are a couple of important lessons you can learn from this story. First, as we've stated, technology is not a panacea. Although a computer system generated the initial report detailing the sales of diapers on Friday evenings, our retail store manager did not make any further use of technology to design and implement her innovative and highly effective solution. Second, this story can help you distinguish between information and business intelligence. In this case, the information was the sales of diapers on Friday evening. The business intelligence, however, included

- *Who* was making diaper purchases on Friday evening.
- *Why* those people were purchasing diapers on Friday evening.
- *What* complementary product(s) those people might also want or need. (This last point might also illustrate the manager’s special *knowledge*.)

As a good rule of thumb, when you receive information and need to make a decision based on it, ask yourself questions that start with who, what, when, why, where, and how. Answers to those questions will help you create business intelligence and make better decisions.

YOUR ETHICAL RESPONSIBILITIES Your roles as a technology-literate and information-literate knowledge worker extend far beyond using technology and business intelligence to gain a competitive advantage in the marketplace for your organization. You must also consider your social responsibilities: This is where ethics become important. *Ethics* are the principles and standards that guide our behavior toward other people. Your ethics have consequences for you just as laws do. But ethics are different from laws. Laws either clearly require or prohibit an action. Ethics are more subjective, more a matter of personal or cultural interpretation. Thus, ethical decision making can be complex. A decision or an action in some cases might have—or be expected to have—an outcome that is actually right or wrong according to different people’s ethics. Consider the following examples of actions:

1. Copying software you purchase, making copies for your friends, and charging them for the copies.
2. Making an extra backup of your software just in case both the copy you are using and the primary backup fail for some reason.
3. Giving out the phone numbers of your friends and family, without their permission, to a telecom provider of some sort of calling plan so you can receive a discount.

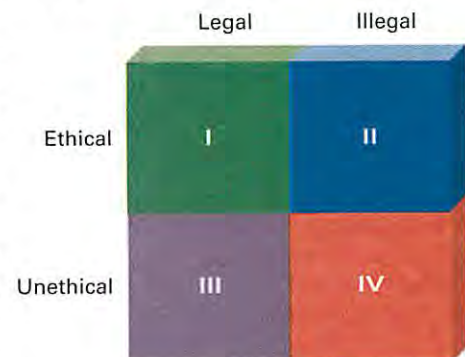

Each of these examples is either ethically (according to you or some people) or legally (according to the government) incorrect or both. In the second example, you might be ethically okay in making an extra backup copy (because you didn’t share it with anyone), but according to some software licenses you’re prohibited by law from making more than one backup copy. What do you think about the first and third examples? Illegal? Unethical? Both?

To help you better understand the relationship between ethical acts and legal acts, consider Figure 1.5. The graph is composed of four quadrants, and the complexity of ethical decisions about behavior is suggested by quadrant III (legal but unethical). Do any of the three examples above fall in quadrant III? Perhaps you can think of some other actions that although legal might still be unethical (how about gossiping?). You always want your actions to remain in quadrant I. If all your actions fall into that quadrant, you’ll always be acting both legally and ethically and thus in a socially responsible way. Clearly, technology has further increased the complexity of ethics in our society because of the speed and casual ease with which people can access, distribute, and use information.

Being socially and ethically responsible in the information age involves not only the actions you initiate yourself but also what you do to protect yourself and your organization against the actions of others—that is, protecting yourself and your organization against cyber crimes.

Figure 1.5

Acting Ethically and Legally⁵

E-LEARNING: NOT JUST FOR SCHOOL

To become effective in your use of information, you can use technology to learn—not only about what information means, but more basically how to perform your work responsibilities better. Brink's Home Security recently implemented an e-learning management system to help (1) train its 2,600 employees, (2) increase customer retention, (3) improve profits, and (4) reduce employee turnover.

Many of Brink's field personnel work nights and weekends, installing home security systems. For them, instructor-led classes in a central location (Brink's has a nationwide field workforce) created problems and simply didn't work.

The new e-learning management system helps managers develop customized online training modules and allows field personnel to access those modules 24 hours per day, seven days per week. The system even provides skills assessment and other forms of evaluation.

The total investment in the system for Brink's was \$300,000. It expects to save \$500,000 in the first three years as a result of replacing instructor-led classes with the e-learning modules. Brink's has already noticed that its better-trained field personnel have improved profit margins and increased customer retention.⁶

There are many types of cyber crimes—such as promulgating viruses or worms, committing identity theft, and engaging in Web defacing—performed by a variety of hackers such as black-hat hackers and cyberterrorists, and it is your responsibility to guard against them. It might even be considered an ethical lapse not to do so. We cannot stress enough how important it is for you to protect yourself and your organization's assets in cyberspace. We'll talk more about these issues in Chapter 8 (Protecting People and Information) and *Extended Learning Module H (Computer Crime and Forensics)*.

INFORMATION TECHNOLOGY AS A KEY RESOURCE IN MIS

The third key resource for management information systems (MIS) is *information technology (IT)*, any computer-based tool that people use to work with information and support the information and information-processing needs of an organization. IT includes a cell phone or PDA that you use to obtain stock quotes, your home computer that you use to write term papers, large networks that businesses use to connect to one another, and the Internet that almost one in every six people in the world currently uses.

KEY TECHNOLOGY CATEGORIES One simple—yet effective—way to categorize technology is as either *hardware* or *software* (see Figure 1.6). *Hardware* is the physical devices that make up a computer. *Software* is the set of instructions that your hardware executes to carry out a specific task for you. So, your PDA is the actual hardware; and it contains software that you use to maintain your calendar, update your address book, check your e-mail, watch videos, obtain stock market quotes, and so on.

All hardware technology falls into one of the following six basic categories:

1. An *input device* is a tool you use to enter information and commands. Input devices include such tools as keyboard, mouse, touch screen, game controller, and bar code reader.
2. An *output device* is a tool you use to see, hear, or otherwise recognize the results of your information-processing requests. Output devices include such tools as printer, monitor, and speakers.

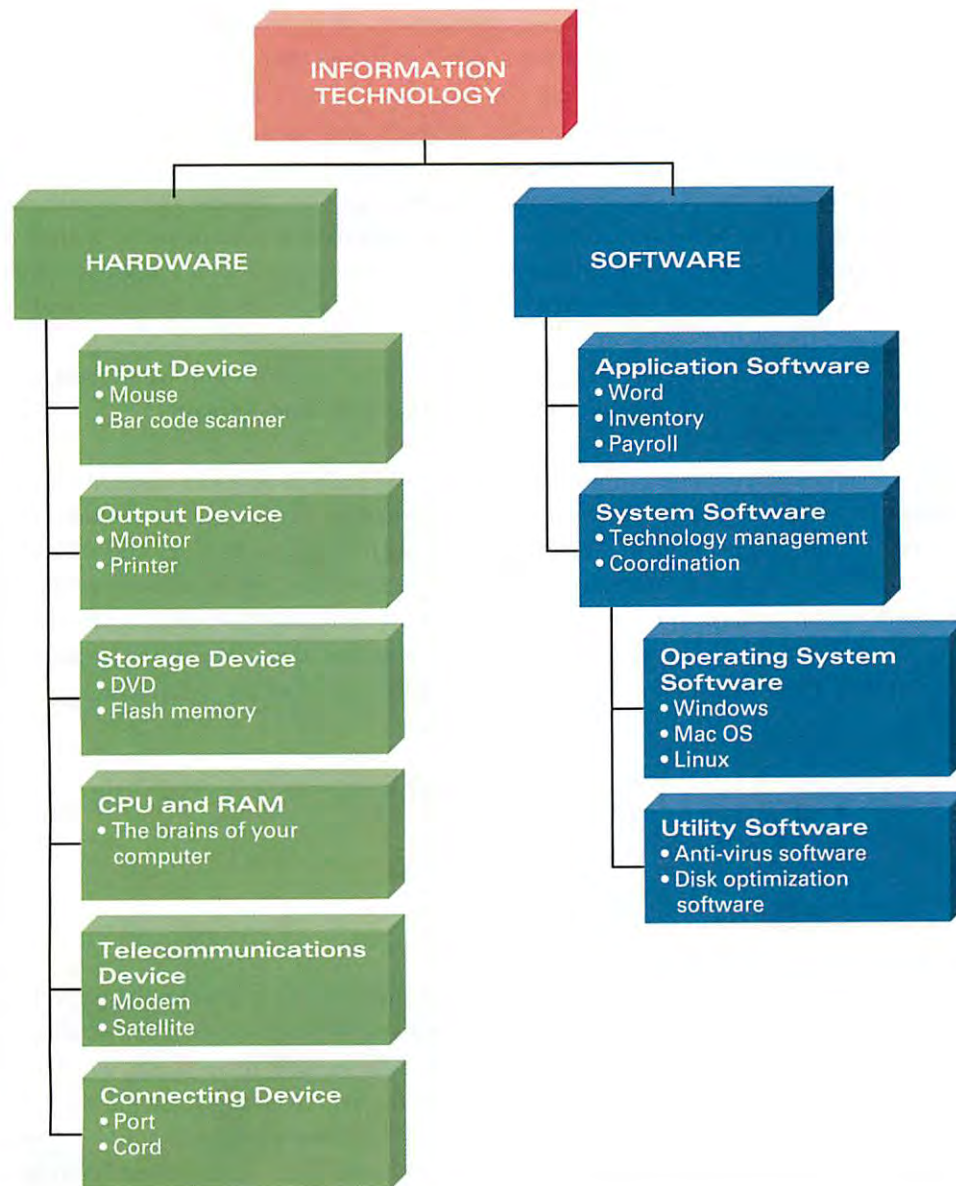

Figure 1.6

Information Technology
Hardware and Software

3. A *storage device* is a tool you use to store information for use at a later time. Storage devices include such tools as thumb drive, flash memory card, and DVD.
4. The *central processing unit (CPU)* is the hardware that interprets and executes the system and application software instructions and coordinates the operation of all the hardware. *RAM*, or *random access memory*, is a temporary holding area for the information you're working with as well as the system and application software instructions that the CPU currently needs.
5. A *telecommunications device* is a tool you use to send information to and receive it from another person or computer in a network. If you connect to the Internet using a modem, the modem is a telecommunications device.
6. *Connecting devices* include such things as a USB port into which you would connect a printer, connector cables to connect your printer to the USB port, and internal connecting devices on the motherboard.

There are two main types of software.: *application* and *system*. **Application software** is the software that enables you to solve specific problems and perform specific tasks. Microsoft Word, for example, can help you write term papers. From an organizational point of view, payroll software, collaborative software, and inventory management software are all examples of application software.

System software handles tasks specific to technology management and coordinates the interaction of all technology devices. System software includes network operating system software, drivers for your printer and scanner, operating system software such as Windows XP and Mac OS, and utility software such as anti-virus software, uninstaller software, and file security software.

If this is your first exposure to technology hardware and software, we suggest you explore *Extended Learning Module A (Computer Hardware and Software)*.

As we have seen, *management information systems* really is all about three key organizational resources—the people involved, the information they need, and the information technology that helps them. MIS is about getting the right technology and the right information into the hands of the right people at the right time. To meet the technology and information needs of your organization, you must understand the industry in which you operate, build the appropriate business strategies, and then identify the important business processes that support the strategies. Finally, you select the right technologies.

Porter's Five Forces Model: Assessing the State of the Competition

Businesses should never “throw technology” at a problem, or use technology just for the sake of technology. To the contrary, businesses engage in discussion and strategic decision making to determine how technology can best support their efforts, which are quite different for each business. As you learn about the field of management information systems and the use of information technology, your foremost question should be: How do businesses decide which technologies to use and when? As we stated earlier, organizations determine which technology to use and when to use it by following a process similar to the following:

1. Assess the state of competition and industry pressures affecting your organization.
2. Determine business strategies critical to success in meeting those competitive and industry pressures.
3. Identify important business processes that support your chosen business strategies.
4. Align technology tools with the important business processes.

In this section we'll examine the first step—understanding the competitive forces within an industry. We'll do so by exploring the use of Porter's Five Forces Model. In the remaining two sections of the chapter, we'll cover several useful models for developing business strategy, the second step above, and then finally we'll cover value-chain analysis as a tool for identifying important business processes. Throughout the entire book, we'll introduce you to technology and discuss its importance for supporting business processes.

LEARNING OUTCOME 2

Figure 1.7

Michael Porter's Five Forces Model

Michael Porter's framework—called the Five Forces Model—has long been accepted as a useful tool for business people to use when thinking about business strategy and the impact of IT.⁷ The *Five Forces Model* helps business people understand the relative attractiveness of an industry and the industry's competitive pressures in terms of the following five forces (see Figure 1.7):

1. Buyer power
2. Supplier power
3. Threat of substitute products or services
4. Threat of new entrants
5. Rivalry among existing competitors

BUYER POWER

Buyer power in the Five Forces Model is high when buyers have many choices from whom to buy, and low when their choices are few. Providers of products and services in a particular industry wish to reduce buyer power. They create a competitive advantage by making it more attractive for customers to buy from them than from their competition. Below are a few of the many companies using IT-enabled processes to reduce buyer power.

- NetFlix.—Set up your movie list. After you watch a movie and return it, NetFlix will send you the next movie on your list.
- United Airlines.—Enroll in the *Mileage Plus* program. As you travel using United (or perhaps make purchases using your United credit card), you accumulate miles for free air travel, upgrades, and hotel stays. Programs like this one, which reward customers based on the amount of business they do with a particular organization, are called *loyalty programs*.
- Apple iTunes.—Create an iTunes account and buy and download whatever music you want. Then, you can organize and manage your music, move it to your iPod, and burn CDs.
- Dell Computer.—Completely customize your computer purchase. It will be delivered to your doorstep within a few business days.

What's interesting about each of these examples (as well as all the others you can think of) is that the competitors in those industries have responded by creating similar programs. This simply means that no competitive advantage is ever permanent. A *competitive advantage* is providing a product or service in a way that customers value more than

what the competition is able to do. Netflix was the first to offer movie rentals (with a profitable business model) using the Internet as the primary platform. Therefore, it had *first-mover advantage*, a significant impact on gaining market share by being the first to market with a competitive advantage. However, Blockbuster and others soon followed with similar offerings, thus nullifying that competitive advantage. Every major airline has a loyalty program similar to that of United Airlines. There are many places on the Internet where you can buy and download music. Almost every major computer vendor allows you to customize your computer purchase. The lesson learned here—and for all strategies that result in a competitive advantage—is that a competitive advantage is only temporary and your organization must constantly innovate to find new competitive advantages.

SUPPLIER POWER

Supplier power in the Five Forces Model is high when buyers have few choices from whom to buy, and low when their choices are many. Supplier power is the opposite of buyer power: As a supplier organization in an industry, you want buyer power to be low and your supplier power to be high.

In a typical supply chain (see Figure 1.8), your organization will probably be both a supplier (to customer organizations) and a buyer, or customer (of other supplier organizations). As a customer of other supplier organizations, you want to increase your buyer power. As a supplier to other organizations, you want to increase your supplier power, thus reducing your customer's buyer power.

In the quest for increasing supplier power, organizations use many tools at their disposal, not just IT. Companies obtain patents and trademarks to minimize the extent to which products and services can be duplicated and offered by other organizations. The De Beers Group for many years has fought fiercely to tightly control the supply and distribution of diamonds. OPEC (the Organization of the Petroleum Exporting Countries) has organized 11 oil-producing nations to better control the distribution of the world's most popular energy resource (supposedly to ensure the stabilization of oil prices).

THREAT OF SUBSTITUTE PRODUCTS OR SERVICES

The *threat of substitute products or services* in the Five Forces Model is high when there are many alternatives to a product or service, and low when there are few alternatives from which to choose. Ideally, your organization would like to be a supplier organization in a market in which there are few substitutes for the products and services you offer. Of course, that's seldom possible in any market today, but you can still create a competitive advantage by increasing *switching costs*. *Switching costs* are costs that make customers reluctant to switch to another product or service supplier. What you need to realize is that a switching cost does not necessarily have to be an actual monetary cost.

Figure 1.8

Evaluating Buyer and Supplier Power for Your Organization

As you buy products at Amazon.com over time, for example, Amazon develops a unique profile of your shopping and purchasing habits through such techniques as collaborative filtering. When you visit Amazon, products are offered to you that have been tailored to your profile. This is only possible through the use of sophisticated technologies. If you choose to do your shopping elsewhere, there is a switching cost of sorts because the new site you visit will not have a profile of you or a record of your past purchases. (This is an effective variant of a loyalty program.) So, Amazon has reduced the threat of substitute products and services, in a market in which there are many substitutes, by tailoring offerings to you, by creating a “cost” to you to switch to another online retailer.

Switching costs can of course be real monetary costs too. You’ve probably been introduced to a switching cost when you signed up for the services of a cell phone provider. All the options and plans sound really great. But there is a serious switching cost in that most cell phone providers require you to sign a long-term contract (as long as two years) in order to receive a free phone or unlimited night and weekend calling minutes. The very successful substitute to this is disposable cell phones that you buy and which contain a certain number of minutes for your use.

THREAT OF NEW ENTRANTS

The *threat of new entrants* in the Five Forces Model is high when it is easy for new competitors to enter a market, and low when there are significant entry barriers to entering a market. An *entry barrier* is a product or service feature that customers have come to expect from organizations in a particular industry and that must be offered by an entering organization to compete and survive. Such barriers are erected, and overcome, and then new ones are created again. This is that vicious business cycle of build a competitive advantage, enjoy first-mover advantage, and then watch your competition develop similar initiatives thereby nullifying your competitive advantage.

For example, if you’re thinking of starting a bank, you must offer your customers an array of IT-enabled services, including ATM use, online bill paying and account monitoring, and the like. These are significant IT-based entry barriers to entering the banking market because you must offer them for free (or a very small fee). If you consider our previous example of cell phone providers, a significant entry barrier in the past had to do with your phone number. Previously, if you wanted to change cell phone providers, you couldn’t take your telephone number with you (i.e., you had to get a new cell phone number). This created a significant entry barrier because new cell phone providers entering the industry were mainly limited to obtaining new customers who did not currently have a cell phone. But that has all changed with *LNP*, *Local Number Portability*, your ability to take your cell phone number with you to a new provider.

RIVALRY AMONG EXISTING COMPETITORS

The *rivalry among existing competitors* in the Five Forces Model is high when competition is fierce in a market, and low when competition is more complacent. Simply put, competition is more intense in some industries than in others, although the overall trend is toward increased competition in just about every industry. Rarely can you identify an industry that exhibits complacent competition. (One example might be mortician and burial services. Solely because of the nature of the services offered, you don’t see mortician and burial service organizations actively advertising on TV, offering reduced rates, and so on.)

The retail grocery industry is intensely competitive. While Kroger, Safeway, and Albertson’s in the United States compete in many different ways, essentially they try

INDUSTRY PERSPECTIVE

COMPARING THE E-COMMERCE ACTIVITIES OF DIFFERENT GOVERNMENTS—A NEW KIND OF COMPETITION

Most people don't think that the government has any competitors but it does in many ways. Think about Social Security, MediCare, and other types of programs that compete with for-profit companies offering retirement programs, health care insurance, prescription medication policies, and so on. Governments even compete with each other, after a fashion, to see who's doing the best job of serving its citizenry.

For example, according to a report presented by the United Nations, the U.S. government ranks first overall in the aggregated categories of number of computers per 100 citizens, number of Internet hosts per 1,000 citizens, percentage of population online, number of telephone lines per 100 citizens, and an information access index (the ease with which government information can be found.) That's pretty impressive.

However, according to a second report released by Accenture, the government of Canada ranked first

in overall citizen satisfaction with the provision of e-government services. Categories in that report included e-government customer relationship management activities, maturity level of delivering services electronically, number of multichannel service delivery options, and extent to which the government shares information with its citizens. So, while the United States has the best infrastructure in place for e-government activities, Canada seems to be the best at determining what its citizens want and need. By the way, the United States ranked third in the Accenture study.

E-government is a major force and player on the Internet. According to Nielsen Net Ratings, the U.S. government ranked sixth among the most popularly visited sites, behind Microsoft, Time Warner (AOL), Yahoo!, Google, and eBay but ahead of the likes of Lycos, Walt Disney, RealNetworks, Amazon, and Ask.^{8, 9, 10}

to beat or match the competition on price. For example, most of them have loyalty programs that give shoppers special discounts. Customers get lower prices while the store gathers valuable business intelligence on their buying habits that helps them craft pricing, advertising, and coupon strategies.

Since margins are quite low in the grocery retail market, grocers build efficiencies into their supply chains, connecting with their suppliers in IT-enabled information partnerships. Communicating with suppliers over telecommunications networks rather than using paper-based systems makes the procurement process much faster, cheaper, and more accurate. That equates to lower prices for customers—and increased rivalry among existing competitors.

As you can see, Porter's Five Forces Model is extremely useful in helping you better understand the positioning of your organization within its industry and in helping you better understand the competitive forces affecting your organization. With this knowledge in mind, your organization's second task is to develop specific business strategies to remain competitive and profitable.

Porter's Three Generic Strategies: Building Business Strategy

The development of business strategies is a vast and wide discipline. There are literally hundreds of methodologies and approaches to the development of business strategy. There are even more books on the subject. (One such book with a particularly

LEARNING OUTCOME 3

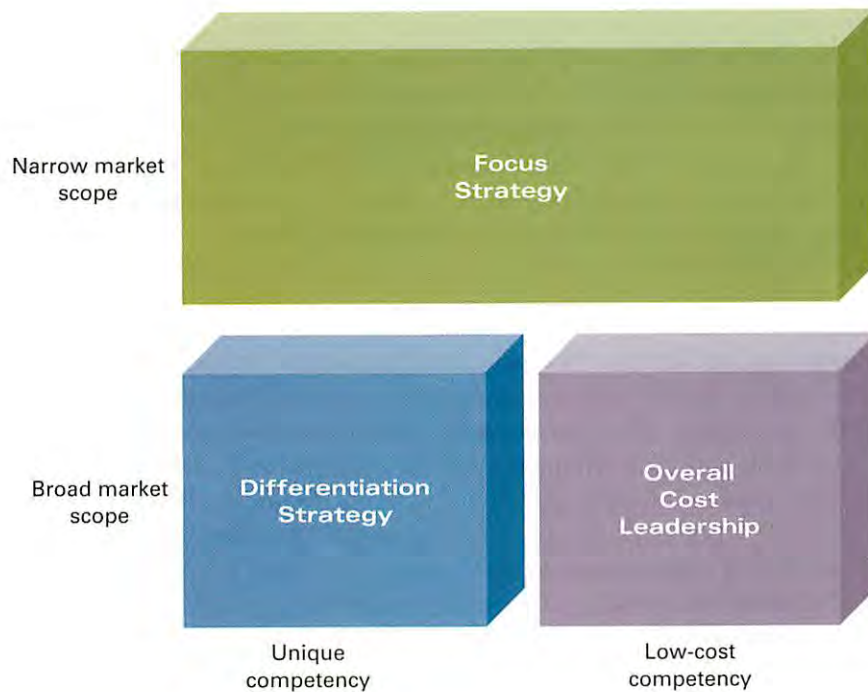

Figure 1.9

Michael Porter's Three Generic Strategies

innovative approach is *Blue Ocean Strategy* by Kim and Mauborgne. Be sure to put it on your wish list of business books to read.) Here, we'll focus on Michael Porter's three generic strategies and two other approaches.

Michael Porter identified three approaches or strategies to beating the competition in any industry (see Figure 1.9). They are

1. Overall cost leadership
2. Differentiation
3. Focus

OVERALL COST LEADERSHIP

Overall cost leadership is defined by Porter as offering the same or better quality product or service at a price that is less than what any of the competition is able to do. Examples of organizations focusing on overall cost leadership are numerous and change almost daily, with the most well-known example being Wal-Mart. Wal-Mart's slogans of "Always Low Prices!" and "Every Day Low Prices" accurately describe the strategy of overall cost leadership. For everything from women's lingerie to car batteries, Wal-Mart's focus is on offering the same products as the competition but at a lower price. Wal-Mart relies on an IT-enabled tight supply chain management system to squeeze every penny possible out of the procurement, distribution, and warehousing of its products. It uses sophisticated business intelligence systems to predict what customers will want and when.

Dell Computer works in similar fashion. Its famous sell-source-ship model of customizing computer purchases is the envy of the industry. Automobile makers Hyundai and Kia similarly attempt to sell reliable low-cost vehicles to a wide audience, in contrast to Hummer and Mercedes-Benz which have no overall cost leadership strategy. The large grocery retail chains we identified earlier such as Kroger, Safeway, and Albertson's essentially compete on price, often offering loss leaders just to get customers in the store. A **loss leader** is a product sold at or below cost to entice customers into a store in the hope

that they will also buy more profitable products. Loss leaders are often placed in the back of the store so customers will have to walk by products with higher profit margins.

IT can be a particularly effective tool if your organization chooses an overall cost leadership strategy. IT can tighten supply chain systems, help you capture and assimilate customer information to better understand buying patterns in an effort to better predict product inventory and shelf placement, and make it easy (efficient) for customers to order your products through Web-enabled e-commerce systems.

DIFFERENTIATION

Differentiation is defined by Porter as offering a product or service that is perceived as being “unique” in the marketplace. Hummer is an excellent example. Its differentiation strategy is reinforced by the unique design and eye-appeal of its H1, H2, and H3 vehicle lines. Even its slogan—“Like Nothing Else”—clearly attempts to differentiate Hummer vehicles from anything on the road. Another example is Lunds & Byerly’s (usually just referred to as Byerly’s) in the grocery retail industry. While other competitors compete mainly on price, Byerly’s focuses on the shopping experience for differentiation. All of the Byerly’s stores offer cooking classes and in-store restaurants for lunch and dinner. Many Byerly’s stores have carpeted floors instead of tile and some even have chandeliers instead of fluorescent lighting.

Apple Computer also focuses on differentiation as a business strategy. Not only do Apple computers look different, they have a different screen interface and focus more on nontextual information processing such as photos, music, and videos than any of the competition. Both Audi and Michelin have successfully created a differentiation strategy based on safety. To be sure, differentiation is not about being different based on lower price—that’s the strategy of overall cost leadership—but the two are interrelated. While many people are willing to pay extra for grocery products at Byerly’s, they are not willing to pay too much extra. Organizations focusing on differentiation must still be concerned about price in relation to the competition.

FOCUS

Focus as a strategy is usually defined as focusing on offering products and services (1) to a particular market segment or buyer group, (2) within a segment of a product line, and/or (3) to a specific geographic market. Focus is the opposite of attempting to be “all things to all people.” Many restaurants focus on only a certain type of food—Mediterranean, Mexican, Chinese, and so forth. Stores such as the Vitamin Cottage Natural Foods Market sell only natural and organic food and nutrition supplements (one form of focus on products within a product line) to a specific buyer group (another form of focus on a particular market segment). Many doctors focus on only a particular type of medical help—oncology, pediatrics, and so on; similarly, many law offices focus on a particular legal venue—workman’s compensation, living trusts, patents and trademarks.

As with the other generic strategies defined by Porter, focus cannot be practiced in isolation. If your organization chooses a particular buyer group on which to focus, you can bet that other competitors will do so as well, so you’ll also have to compete on price (overall cost leadership) and/or differentiation too.

TWO INTERESTING AND COMPLEMENTARY STRATEGY FRAMEWORKS

Besides Porter’s three generic strategies, there are numerous other strategy frameworks. Most people tend to use more than one as each provides another perspective from which

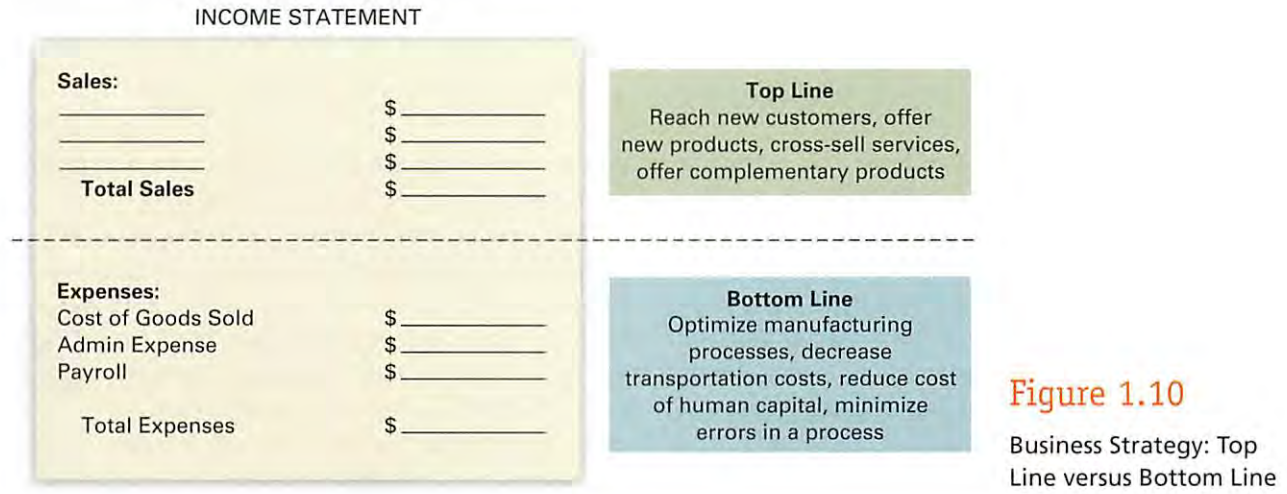

Figure 1.10
Business Strategy: Top Line versus Bottom Line

to make decisions regarding the best business strategy given the competitive pressures of the industry. Here, we'll briefly look at two other frameworks; you'll easily see they are both different from and similar to Porter's three generic strategies (and each other).

TOP LINE VERSUS BOTTOM LINE A typical income statement for a business has two main parts: (1) revenues and (2) expenses (see Figure 1.10). Revenues are monies your organization receives from selling its products and services while expenses are the costs it incurs providing those products and services. From a strategy point of view, you can focus on the "top line" (revenues) or the "bottom line" (expenses).

When focusing on the top line, your strategy is to *increase revenues*, which can be achieved any number of ways—reaching new customer segments, offering new products, cross-selling related services, offering complementary products, just to name a few. Conversely, when focusing on the bottom line, your strategy is to *minimize your expenses* in making your products or providing your services, which can be achieved in a number of ways as well—optimizing manufacturing processes, decreasing transportation costs, reducing the costs of human capital, minimizing errors in a process, again to name just a few. A bottom-line strategy is similar to Porter's strategy of overall cost leadership. And a top-line strategy is analogous to either or both differentiation and focus as defined by Porter. You will never focus solely on one to the neglect of the other; rather, you will focus on some combination of the two, since they are means to the same end (greater profitability).

From an IT point of view, you must form a business strategy that addresses the role of IT in affecting both the top line and bottom line, though not necessarily equally. For example, you could use technology to implement a customer self-service system on the Web. A **customer self-service system** is an extension of a transaction processing system that places technology in the hands of an organization's customers and allows them to process their own transactions. (A **transaction processing system** or **TPS** is a system that processes transactions within an organization.) Online banking and ATMs are examples of self-service systems. With these, bank customers have the ability to do their banking anywhere at anytime.

Online banking and ATMs have allowed banks to reduce the costs associated with the delivery of many types of services. Thus, they support a bottom-line strategy. Financial institutions also use these IT-enabled systems to attract new customers. Many financial institutions now also offer various products such as stamps for sale through ATMs.

INDUSTRY PERSPECTIVE

CREATING SYNERGY AMONG TOP LINE AND BOTTOM LINE

Top-line and bottom-line initiatives are different means to the same end: increased net profit. Top-line initiatives achieve that end by focusing on increasing revenue while bottom-line initiatives achieve that end by focusing on decreasing costs. What you really hope to find is a technology-supported initiative that will allow you to do both—simultaneously increase revenues and decrease costs. That's what UrbanFlorist was able to.

A Canadian retailer serving all of Canada and most of the United States, UrbanFlorist previously processed all orders manually, which required each and every order to pass through the hands of at least 11 people. According to Alif Somani, CEO of UrbanFlorist, "We used to have a very heavy paper trail and our staff handled almost 10,000 printed pages per day." The manual

process also led to a 6 percent error rate in handling the orders.

Using order management software provided by CommercialWare, UrbanFlorist was able to cut error rates in half to 3 percent and realize a 15 percent increase in sales per representative. This is an excellent example of a technology-supported initiative that led to both a bottom-line result (decrease in costs—error rates in this example) and a top-line result (increase in revenues as measured by sales representative productivity).

Alif sums it up best in these statements: "We have invested in a technology that supports our customer service department so that they can do their jobs more effectively . . . After all, our concern is not putting out orders but taking care of customers' needs, and having the right technology in place is essential to do that."¹¹

Again, this is an example of using IT to focus on the top line, increasing revenues, by selling new products.

As you learn about various technologies in this book, ask yourself

1. How can I apply these technologies in a business environment to help my organization implement a top-line strategy (i.e., increase revenues)?
2. How can I apply these technologies in a business environment to help my organization implement a bottom-line strategy (i.e., minimize expenses)?

RUN-GROW-TRANSFORM FRAMEWORK A helpful conceptual framework for viewing the bigger organizational picture and determining the use of IT in it is the *run-grow-transform (RGT) framework*, an approach in which you allocate in terms of percentages how you will spend your IT dollars on various types of business strategies. For example, if you're only interested in "business-as-usual" but cheaper and faster than the competition, you would focus a great percentage of your IT dollars on a "run" strategy. If you wanted to transform your business in some way, you would allocate a certain percentage of your IT dollars to a "transformation" strategy. The following are the aspects of the RGT framework:

- *Run*—optimize the execution of activities and processes already in place. Seek organizational growth through offering products and services faster and cheaper than the competition.
- *Grow*—increase market reach, product and service offerings, expand market share, and so on. Seek organizational growth by taking market share from the competition (i.e., get a bigger piece of the pie).
- *Transform*—innovate business processes and/or products and services in a completely new way, move into seemingly different markets, and so on. Seek organizational growth through new and different means.

As you can see, the RGT framework is similar in many ways to both Porter's three generic strategies and a top-line versus bottom-line approach as follows:

- Run = overall cost leadership = bottom line
- Grow = focus and differentiation = top line
- Transform = (new) differentiation = top line (when the focus is innovation)

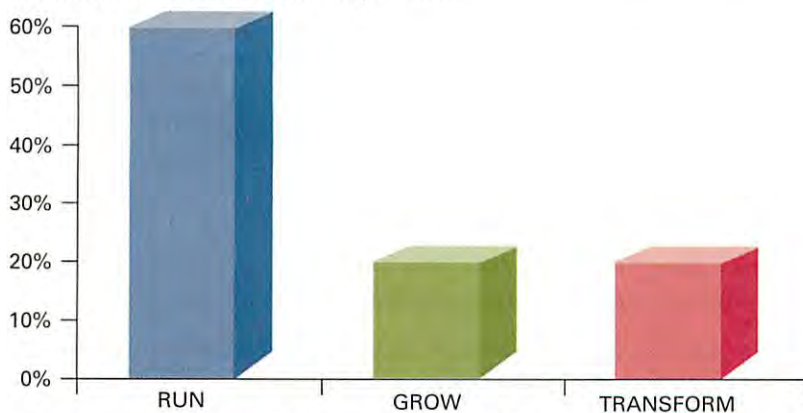

The application of the RGT framework is often best considered with an eye to the maturity of the organization and the maturity of the industry (see Figure 1.11). A new venture start-up, for example, will often focus more of its efforts on the grow aspect, while a mature organization—with a well-defined and successful line of products and services—in a mature industry will often focus more of its efforts on the run aspect. In the latter instance, the organization may already be a market leader and want to ensure and sustain its competitive advantage through price and cost optimization.

Regardless of maturity, however, all organizations must focus on the *transformation* aspect. In the business world, as is often said, if you're standing still, you're falling behind. It's a simple fact—your competition is always trying to do something better than you are. Therefore, your organization must constantly seek to evolve and, in most cases, to transform itself. Many times, your organization can take a proactive approach to using technology to transform itself. Below are just a few of the many examples of organizations that have focused on transformation.

- eBay.—The world's most popular online auction site, a few years ago, eBay acquired PayPal and began offering payment services to its buyers and sellers. In

A new venture start-up focusing less on running the organization and more on growing and transforming the organization.

A mature organization within a mature industry focusing mainly on efficiently running the organization.

Figure 1.11

Illustrations of the Run-Grow-Transform (RGT) Framework

2003, it began offering its own credit card (a great example of transformation), with its “Anything Points” program offering eBay members the ability to buy products and pay for seller services with points accumulated from using a credit card.

- General Motors (GM).—Many people believe that GM’s core competency is the production of automobiles. While that may be true, a major portion of its revenue comes from the financing of automobiles (and other big-ticket items such as homes). Its financing business segment (GMAC) is now more profitable than the actual manufacturing and selling of automobiles. GM doesn’t want you to pay cash for a car—it wants you to finance the purchase or lease the car through GMAC.
- AOL.—In March 2004, America Online (AOL) launched a streamlined new service for online bill payments. Although it doesn’t yet provide you with the capability of paying online bills directly through AOL, the initiative (called *AOL Bill Pay*) does seem to indicate that AOL is positioning itself to potentially transform from a pure Internet service provider (ISP) to an online bank in the future.
- Disney.—Known for its famous characters like Mickey, Disney now offers cell phone service targeted at families with children. Ring tones can be character voices, parents can set minute limits for children, and all subscribers can access Disney content year round.

Like these examples, your organization too must constantly seek to transform itself. The highly competitive business environment necessitates this focus on evolving toward ever greater competitive advantage. IT can help.

Identifying Important Business Processes: Value-Chain Analysis

LEARNING OUTCOME 4

Thus far, you’ve learned how to (1) understand your organization within the context of its industry and competitive pressures and (2) define your organization’s major strategy for effectively competing using three approaches—Porter’s three generic strategies, top line versus bottom line, and the run-grow-transform framework. Now, your organization is at a point “where the rubber meets the road” with respect to how technology will be used in a positive way to affect various processes in support of your strategy. A helpful tool is *value-chain analysis*. **Value-chain analysis** is a systematic approach to assessing and improving the value of business processes within your organization to further increase its competitive strengths.

A **value chain** is the chain or series of business processes, each of which adds value to your organization’s products or services for customers. A **business process** is a standardized set of activities that accomplishes a specific task for instance, processing a customer’s order, delivering the customer order, service after the sale, and so on. Overall, value-chain analysis helps your organization identify valuable business processes.

Figure 1.12 depicts the typical components of a value chain. The chain of **primary value processes** along the bottom half takes in the raw materials and makes, delivers, markets and sells, and services your organization’s products or services.

- *Inbound logistics*—receiving and warehousing raw materials and distributing those raw materials to manufacturing as needed.
- *Operations*—processing raw materials into finished products and services.

Figure 1.12

The Components of
a Value Chain

- *Outbound logistics*—warehousing and distributing finished products and services.
- *Marketing and sales*—identifying customer needs and generating sales.
- *Service*—supporting customers after the sale of products and services.

Support value processes along the top half of the chain—firm infrastructure (culture, structure, control systems, accounting, legal, and so on), human resource management, technology development, and procurement (purchasing of raw materials)—support the primary value processes. Your organization requires these support value processes to ensure the smooth operations of the primary value processes.

Your organization's margin or profit depends on how well you perform both the primary value processes and support value processes. That is, the amount that your customers are willing to pay (defining the value your customers place on your products and services) must exceed the cost of the processes in the value chain. This concept is similar to top-line and bottom-line strategies in that your success (profit) depends on the revenue from customers (top line) exceeding the costs of your operations (bottom line).

If you've ever purchased a necktie, you may have heard of the Robert Talbott Company of Carmel Valley, California.¹² Talbott is a premier necktie manufacturer in the United States. Talbott traditionally shunned the use of technology; for example, all of its tie orders were written on paper forms. That used to work fine, because Talbott always ensured value-added by utilizing high-quality workmanship, unique designs, and fine fabrics. However, in today's fast-changing consumer market customers want constantly updated styles and more of them. Talbott now creates four neckwear lines for Nordstrom each year with up to 300 designs per line.

How might a value-chain analysis help Talbott in its operations? It could do so by identifying both value-added and value-reducing processes within its value chain. Let's look at the identification of value-added processes first.

IDENTIFYING PROCESSES THAT ADD VALUE

Talbott should first construct a survey instrument for its customers and ask which of the processes (both primary and support) within the value chain add the most value. This type of survey is often in a format in which a customer must assign a total of 100 points

Value-Chain
Processes

Figure 1.13

The Value-Added View of a Necktie Manufacturer

across all the processes. Then, by summing all the responses and creating a percentage of total for each process, Talbott can determine which processes add the most value. Figure 1.13 depicts one possible customer survey result. Notice how the processes in the figure are sized to depict the value that customers attribute to each process. The largest value-added source is the high-quality manufacturing process. Still, a close second is the purchasing procurement process that provides access to high-quality silks and other fabrics. As these processes are the ones that are most visible to customers, they will quickly add even more value when supported by IT. Therefore, Talbott has created a computer-aided design system to reduce the time it takes to create and manufacture new ties. It could also further strengthen its quality control systems to ensure that the procurement of raw materials results in the highest quality of silks and other fabrics.

IDENTIFYING PROCESSES THAT REDUCE VALUE

After identifying value-added processes, it's important to identify those processes that reduce value for the customers. To do this, Talbott creates a second part to its survey instrument. In this part, Talbott asks customers to assign 100 points across all processes according to which processes reduce value. Then, by once again summing all the responses and creating a percentage of total for each process, Talbott can determine which processes reduce value the most.

Talbott identified the marketing and sales process as the process that reduced value the most, as shown in Figure 1.14. It found that sales were lost because salespeople were promising neckties that were out of stock. Customers were beginning to lose faith in Talbott's ability to deliver high-quality ties. They saw this process failure as one that reduced Talbott's value to them as customers.

To correct its marketing and sales process deficiencies, Talbott implemented a new IT system to get timely product information to the sales force. Using laptop computers, the sales force now carries product line information on the road with them. They place orders over their computers from their hotel rooms and receive inventory updates at the same time. As a result, neckties that customers want are on the shelves on a timely basis and customers have new faith in an old friend who now adds more value than ever.

Evaluating value chains is particularly effective because it forces your organization to gather and analyze quantifiable information from your customers. It eliminates much of the "flying by the seat of your pants" in making decisions. And as you begin to quantify important

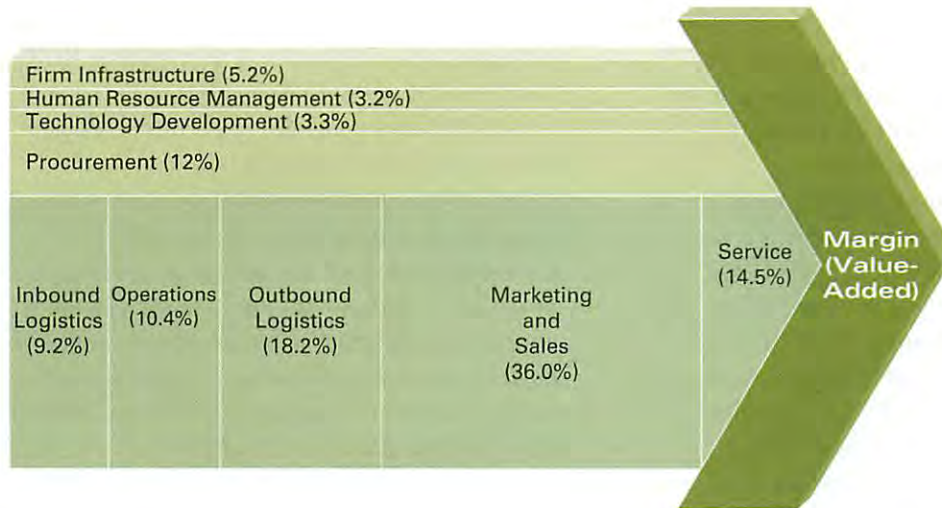

Figure 1.14

The Value-Reduced View of a Necktie Manufacturer

information, you can build a better return-on-investment case for the acquisition, development, and use of IT to further add value to your processes and reduce ineffectiveness.

To briefly summarize our main points in this chapter, management information systems (MIS) is all about people using technology to work with information as they support the organization in its quest for a competitive advantage. You can't blindly apply technology; you must carefully select technology within the context of the competitive pressures of your industry, the business strategies that you choose, and the important business processes you identify.

Summary: Student Learning Outcomes Revisited

1. **Define management information systems (MIS) and describe the three important organizational resources within it—people, information, and information technology.** *Management information systems (MIS)* deals with the planning for, development, management, and use of information technology tools to help people perform all tasks related to information processing and management. People, as an organizational resource within MIS, are the most important of the three. To be successful in their use of technology, people must be both *information-literate* and *technology-literate*. Information in various forms goes by many names such as *data*, *business intelligence*, and *knowledge*. All are intellectual assets but exhibit subtle differences. *Information* is data that has meaning within a specific context. *Information technology (IT)* is any computer-based tool that people use to work with information and support the information and information-processing needs of an organization.
2. **Describe how to use Porter's Five Forces Model to evaluate the relative attractiveness of and competitive pressures in an industry.** Porter's *Five Forces Model* focuses on industry analysis according to five forces: (1) *buyer power*—high when buyers have many choices and low when choices are few; (2) *supplier power*—high when buyers have few choices and high when choices are many; (3) *threat of substitute products and services*—high when many alternative are available and low when alternatives are few; (4) *threat of new entrants*—high when it is easy to get into a market and low when it is difficult to get into a market; and (5) *rivalry among existing*

competitors—high when competition is fierce and low when competition is more complacent.

3. **Compare and contrast Porter’s three generic strategies; top line versus bottom line; and the run-grow-transform framework as approaches to the development of business strategy.** Porter’s *three generic strategies* are: (1) *overall cost leadership*—the same or better quality products at a price less than that of the competition; (2) *differentiation*—a product or service that is perceived as being “unique;” and (3) *focus*—products or services for a particular buyer group, within a segment of a product line, and/or a specific geographic market. A *top-line* strategy focuses on increasing revenues by increasing market share, cross-selling complementary products, etc. A *bottom-line*

strategy focuses on decreasing costs by optimizing processes, reducing errors, etc. Finally, the *RGT framework* requires that you allocate in terms of percentages how you will spend your IT dollars among running the organization, growing the organization, and transforming the organization.

4. **Describe the role of value-chain analysis in identifying value-added and value-reducing processes.** *Value-chain analysis* is a systematic approach to assessing and improving the value of business processes within your organization to further increase its competitive strengths. Value-chain analysis allows you to gather customer data and quantifiably assess the extent to which different processes add value and reduce value, thus identifying those processes that would benefit from IT support.

CLOSING CASE STUDY ONE

EXPLORING YOUR SPACE AT MYSPACE.COM

While being interviewed by *The Hollywood Reporter* concerning MySpace, Rupert Murdoch stated, “In a sense, we say we’ve got 30 million portals.” In November 2005, MySpace.com boasted having 37 million registered users, growing at an unbelievable pace of 4 million new members per month. According to comScore, it ranked third in page views among all domains.

Social networking sites are an interesting phenomenon on the Web. In a sense, eBay (www.ebay.com) is a social networking site that supports the gathering of consumer buyers and sellers. Epinions.com (www.epinions.com) is a social networking site enabling consumers to share product reviews. Wikipedia (www.wikipedia.org) is a social networking site focusing on the development of free open-source information and content.

In MySpace.com, you create and maintain your own “portal,” a sort of personal Web site. In that portal, you create a personal page about yourself, sharing just about any information you care to. You can include photos, create a blog about a topic of interest, and establish relationships with other people in chat rooms.

Beyond just personal social networking, MySpace is becoming the space for many types of businesses. Most notably, musicians and bands are using MySpace to post and sell music. Over 660,000 musicians and bands maintain user profiles on MySpace. And those musicians

aren’t just limited to fledgling “wannabes.” Madonna pursued an aggressive campaign at MySpace for her new album *Confessions on a Dance Floor*. Madonna even posted her own confessions on MySpace, describing how she loves to go through people’s bags while they’re not looking (and other questionable acts). Other MySpace users can watch Madonna’s videos and even copy and paste them into their own profile sections.

Television shows and movies are also jumping into MySpace. TV shows like *Family Guy*, *The Man Show*, and *Kitchen Confidential* have a MySpace presence. Popular movies like *Walk the Line* and *Saw II* have their own space.

Book publishers spend extensive time reading and reviewing self-print books written on MySpace. Many people have found MySpace to be an excellent venue for self-publishing a book, getting people to read it, and getting publishers to take a look at their manuscripts. Many book publishers have profiles on MySpace and encourage authors to submit books and manuscripts there.

Of course, there is also a dark side to MySpace. Recently, a man created a MySpace portal and used it to attract underage girls for the purpose of committing sexual acts with them. He was caught but not before making contact with several young girls.^{13,14}

Questions

1. Visit MySpace (www.myspace.com). What process do you go through to create your own personal portal? Do you have to pay a fee? What information do you have to provide MySpace to create a personal portal?
2. Search for a “friend” on MySpace. How do you do this? What are the search criteria you can use?
3. Peruse the various blogs on MySpace. What seem to be the dominant blog topics? Did you find any blogs that are of questionable social value (according to your own ethics)? If so, what were the topics?
4. Search for your favorite garage band or perhaps a popular well-known band. What content were you able to find? Could you view a music video? If so, could you view the entire video or just a segment of it?
5. In your opinion, why have social networking sites grown in popularity? Do you have a MySpace profile? If so, why did you create it?
6. According to one account, MySpace is designed to be “unedited and democratic.” But as you read above, MySpace has been used by pedophiles to attract young children. Should MySpace be completely uncontrolled and unedited? Does MySpace have a societal obligation to censor questionable content? In your view, what does “questionable content” mean?
7. A growing and significant competitor to MySpace is Cyworld (www.cyworld.com). Visit Cyworld and compare it to MySpace. If you don’t have an account at either and had to choose one, which would you choose and why? If you have a MySpace account, what features does Cyworld offer that are not present at MySpace? If you have a Cyworld account, what features does MySpace offer that are not present at Cyworld? Do you have an account at both? If so, why?

CLOSING CASE STUDY TWO

IS THE WORLD DUMPING DATA ON YOU?

It goes by many terms—information overload, analysis paralysis, data dumping, and so on. You know what we’re talking about. It is indeed great to live in the information age with a plethora of digital technologies at your fingertips giving you access almost instantly to massive amounts of information. But is all of that information really useful? Do you find yourself spending hours on end searching through that vast amount of information to find exactly what you need? Are search engines really good at helping you quickly locate the exact information you need?

Those are very important questions in the business world. Time is money, and time spent looking for the right information is wasted time and therefore an increased cost which results in a decrease in profits. An Accenture study of 1,009 managers at U.S. and U.K. companies with annual revenues exceeding \$500 million in revenues revealed the following startling facts:

- IT managers spend 30 percent of their time trying to find information relevant to their jobs.
- 42 percent say they are bombarded by too much information.
- 44 percent complain that other departments don’t share data.
- 39 percent can’t figure out which information is current.
- 38 percent often receive duplicate data.
- 21 percent don’t understand the value of the information once they receive it.
- 84 percent say they store information on hard drives or e-mail and don’t share data that might be relevant to others.
- Only 16 percent state that they use collaborative tools, essentials tools for sharing information.

Information is a critical and valuable resource to any organization. It can easily be shared and used by

many people, unlike other resources such as money. Knowing the right information about your competitors, your own internal operations, and your customers can yield a significant competitive advantage in the marketplace.

From a personal point of view, having the right information is essential as well. It will help you pick the right classes to take and when. It can make you more efficient and effective in writing term papers. It can help you with your taxes, plan your retirement, and determine which car best fits within your budget and meets your needs.¹⁵

Questions

1. Critically evaluate the bulleted list of information-related items in this case study. How are each contradictory to the notion of being an information-literate knowledge worker?
2. Consider again Figure 1.1 on page 5 and the steps we presented in the chapter for determining which technologies are most appropriate in an organization. Why is this process so important? During *each* of the four steps in that the decision process, what information should be derived and used in the next step?
3. Again, considering the four steps in determining which technologies are most appropriate in an organization, for the information you identified as crucial to be derived during each step in Question 2, which of that information is internal, external, objective, or subjective information? Which information is some combination of internal, external, objective, or subjective?
4. Is it ethical for people in an organization to withhold information and not share it with other employees? Under what circumstances would it be acceptable not to share certain types of information with other employees? What can organizations do to encourage their employees to share information?
5. What about your personal life at your school? How easy is it to find the following information on your school's Web site?
 - The course description for the classes you are currently taking.
 - A list of classes you need to take to complete your degree.
 - The requirements you must meet to qualify for various types of government-supported loan programs.
 - The process you go through to apply for graduation.
6. Overall, how would you rate your school's Web site in terms of providing the information you need? How would you rate your school's Web site in terms of allowing you to process your own transactions, such as signing up for a class, scheduling time with an advisor, and so on?

Key Terms and Concepts

Application software, 16	Garbage-in garbage-out (GIGO), 9	Output device, 14

Short-Answer Questions

1. What is the relationship between management information systems (MIS) and information technology (IT)?
2. What four steps should an organization follow in determining which technologies to use?
3. What are some relationships among data, information, business intelligence (BI), and knowledge?
4. How does the granularity of information change as it moves from lower to upper organizational levels?
5. What is the difference between a technology-literate knowledge worker and an information-literate knowledge worker?
6. How do ethics differ from laws?
7. What role does the Five Forces Model play in decision making?
8. Why are competitive advantages never permanent?
9. What are the three generic strategies according to Michael Porter?
10. How are Porter's three generic strategies, a top-line versus bottom-line approach, and the RGT framework similar?
11. Why is value-chain analysis so useful to companies?

Assignments and Exercises

1. **USING PORTER TO EVALUATE THE MOVIE RENTAL INDUSTRY** One hotly contested and highly competitive industry is the movie rental business. You can rent videos from local video rental stores, you can order pay-per-view from the comfort of your own home, and you can rent videos from the Web at such sites as Netflix. Using Porter's Five Forces Model, evaluate the relative attractiveness of entering the movie rental business. Is buyer power low or high? Is supplier power low or high? Which substitute products and services are perceived as threats? Can new entrants easily enter the market? What are the barriers to entry? What is the level of rivalry among existing competitors? What is your overall view of the movie rental industry? Is it a good or bad industry to enter?
2. **REVIEWING THE 100 BEST COMPANIES TO WORK FOR** Each year *Fortune* magazine devotes an issue to the top 100 best companies to work for. Find the most recent issue of *Fortune* that does this. First, develop a numerical summary that describes the 100 companies in terms of their respective industries. Which industries are the most dominant? Pick one of the more dominant industries (preferably one in which you would like to work) and choose a specific highlighted company. Prepare a short class presentation on why that company is among the 100 best to work for.
3. **YOUR SCHOOL'S VALUE CHAIN** Develop a value chain for your school. You don't have to gather information to construct the value chain, but you do have to determine which processes are support value processes and which processes are primary value processes. Draw your value chain according to Figure 1.12 on page 27. Finally, list the three most important processes to you as a student and provide a short explanation of why they are the most important to you.
4. **BUSINESS STRATEGY FOR ENTERING THE CELL PHONE SERVICE INDUSTRY** Assume that you run a start-up and have decided to enter the cell phone service industry. Which of the three generic strategies would you choose as your primary business strategy—overall cost leadership, differentiation, or focus? Explain your choice by elaborating on the product and service features you would offer to lure customers from the competition.

5. RESEARCHING YOUR CAREER AND INFORMATION TECHNOLOGY To position yourself in the best possible way to succeed in the business world, you need to start researching your career right now. Here, we would like you to focus on the IT skills your

career requires. First, consider what career you want to have. Second, visit Monster.com (www.monster.com) and search for jobs that relate to your career. Read through several of the job postings and determine what IT skills you need to acquire.

Discussion Questions

1. The three key resources in management information systems (MIS) are information, information technology, and people. Which of these three resources is the most important? Why? The least important? Why?
2. We often say that hardware is the *physical* interface to a technology system while software is the *intellectual* interface. How is your hardware your physical interface to your computer? How is your software your intellectual interface to your computer? Do you see technology progressing to the point that we may no longer distinguish between hardware and software and thus no longer perceive differing physical and intellectual interfaces?
3. In a group of three to four students, consider eBay in the context of Porter's Five Forces Model. How does eBay reduce the threat of new entrants? If necessary, you may want to explore eBay's site (www.ebay.com) and determine the role of buyer and seller ratings, its integration with PayPal, and how it helps buyers and sellers resolve disputes.
4. In this chapter, we discussed the use of loyalty programs in the travel industry as a mechanism for reducing buyer power. What is another industry that also uses loyalty programs to reduce buyer power? How does that industry use loyalty programs to do so?
5. As an information-literate knowledge worker for a local distributor of imported foods and spices, you've been asked to prepare a customer mailing list that will be sold to international cuisine restaurants in your area. If you do so, will you be acting ethically? Suppose you don't consider the proposal ethical. What will you do if your boss threatens to fire you if you don't prepare the list? Do you believe you would have any legal recourse if you didn't prepare the list and were subsequently fired?
